

Work Assignment: LinkedIn Tender & Scheme Tracker

Internal automation tool — Requirements & Instructions for Development

Field	Details
Project name	LinkedIn Tender & Scheme Tracker
Assigned by	HARSH JAIN/ VIJAY GAUTAM
Date assigned	16/07/2026
Target completion	[21/07/2026] Estimated
Priority	High

1. Objective

Build an internal tool that collects yesterday's LinkedIn posts from the accounts we follow, filters out posts related to **tenders, schemes, projects, RFPs, yojana, orders, and bids**, saves them into an Excel sheet, and generates a short summary for each relevant post. The tool is for internal office use by one user, run once per day.

2. How It Should Work (User's Point of View)

1. The user runs the tool once a day (double-click or single command).
2. A Chrome window opens using the user's already-logged-in LinkedIn profile. The script must never handle or store the LinkedIn password, and must never automate the login page.
3. The script visits the recent-activity pages of a defined list of target people/companies (list kept in a config file) and collects posts from the last 24–48 hours.
4. Posts are filtered by keywords (tender, scheme, RFP, EOI, bid, yojana, project, contract, procurement — keyword list must be editable in the config file, not hard-coded).
5. Matching posts are appended as new rows in a master Excel file. Duplicates (posts already captured on a previous run) must be skipped automatically using the post URL as the unique key.
6. For each new post, a summary of 3–5 lines is generated and written into the Summary column. A detailed summary text file is also saved into a "summaries" folder, and its file path is written into the Excel row.
7. At the end, the script prints/logs a short report: how many posts scanned, how many matched, how many added.

3. Excel File Structure

Column	Description
Sr. No.	Auto number
Date Collected	Date the script captured the post
Post Date	Date/time of the LinkedIn post
Author	Name of person/company who posted
Post Text	Full text of the post
Post URL	Direct link to the post (also used as duplicate-check key)

Column	Description
Category	Tender / Scheme / Project / Other (based on keyword matched)
Summary	3–5 line generated summary
Summary File	Path of the detailed summary file in the summaries folder
Status	New / Reviewed / Action Taken (filled manually by user)
Remarks	Manual notes column

4. Important Constraints and Risks (Must Read)

- **Account safety:** automating LinkedIn is against LinkedIn's terms of service and carries a real risk of account restriction. To reduce risk: run at most once per day, keep total session time under ~10 minutes, use random delays between actions, never run headless, and never automate login. Management accepts the residual risk; the engineer must implement all the precautions above.
- **Breakage is expected:** LinkedIn changes its HTML structure frequently. The collector should use stable selectors where possible, fail gracefully with a clear error message, and be written so selector fixes are quick (keep all selectors in one place in the code).
- **Feed limitation:** do not rely on scrolling the main feed — it is algorithmic and incomplete. Use the per-profile activity pages of the target list instead.
- **Data stays local:** all collected data, the Excel file, and summaries remain on the office machine. Do not upload post data anywhere except the summarisation API call.

5. Acceptance Criteria

- Runs end-to-end with a single command/double-click on the office machine.
- Correctly captures posts from at least 10 test target profiles from the last 24–48 hours.
- No duplicate rows are created when the script is run twice on the same day.
- Keyword filtering and the target list are changeable from the config file without editing code.
- Summaries are accurate, 3–5 lines, and detailed summary files open correctly from the paths in the Excel sheet.
- Excel file opens cleanly in MS Excel with no corruption after repeated runs.
- If LinkedIn layout changes and the script fails, it exits with a clear error message instead of writing wrong/empty data.

Questions / clarifications: contact VIJAY/HARSH. Before starting, please confirm the target profile list and the keyword list with the undersigned.
